**Listing of the Claims**

1-26. Canceled

27. (New) A receiver for receiving a signal comprising a modulated carrier, with a frame having a first and second training sequences, comprising:

a frequency offset estimation unit for receiving the signal and obtaining initial information relating a carrier frequency offset from an autocorrelation signal obtained by autocorrelation of the first training sequence and for obtaining an estimate of a carrier frequency offset from an autocorrelation signal obtained by autocorrelation of the second training sequence of the received signal;

a frequency offset compensation unit for compensating the received signal with the frequency offset obtained from the frequency offset estimation unit to form a compensated received signal, and

a time reference determining unit for obtaining a timing reference for the received signal by cross-correlation of the compensated received signal with a known training sequence.

28. (New) The receiver according to claim 1, wherein the time reference determining unit is adapted to obtain a first timing reference for the received signal by autocorrelation of the received signal and a second timing reference for the received signal by the cross-correlation of the compensated received signal with the known training sequence.
